

Report Quiz 1 - Web Programming C

Gilbran Mahdavia Raja - 5025241134

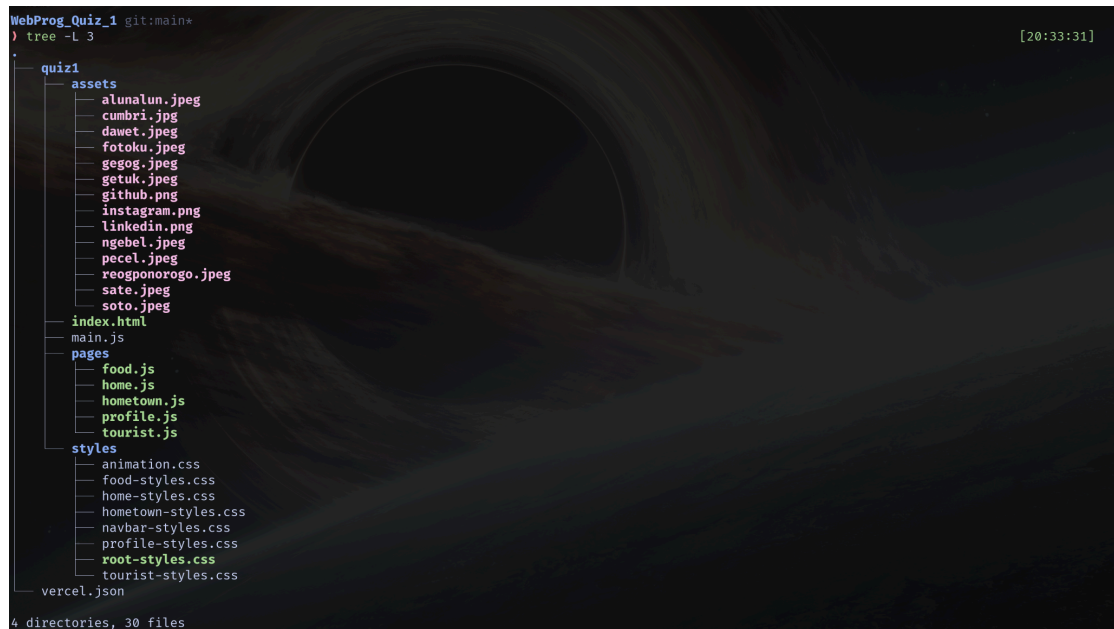

1. Design Concept

For this project, I made a website for my quiz assignment. The website has five pages Home, Profile, Hometown, Local Food, and Tourist Place. I build the design with trial and error, because I try many times until it looks better. I also get inspiration from online websites, especially for CSS animation. The animation makes the website look more interesting and not too plain. The website is still not responsive, so it works better on desktop than mobile. Even with simple design, this project shows my learning process to mix my own ideas with examples from the internet.

Website Structure:

The website uses a client-side routing system. Each page is mapped to a specific URL path in the routes object. When a user clicks a navigation link, JavaScript prevents the page from reloading and instead updates the URL with `history.pushState`. Then the `router()` function loads the correct page content into the `<div id="app">`. The system also supports browser back/forward navigation with `popstate` and runs animations during page transitions.

here's my folder structure:

Tentang Ponorogo

Kabupaten Ponorogo adalah salah satu kabupaten yang terletak di Provinsi Jawa Timur, Indonesia. Kabupaten ini dikenal sebagai kota budaya dengan julukan Kota Reog, karena menjadi asal dari kesenian tradisional Reog Ponorogo yang terkenal hingga mancanegara. Ponorogo memiliki perpaduan antara budaya, sejarah, dan tradisi yang kuat, sehingga masyarakatnya tetap melestarikan nilai-nilai kearifan lokal dalam kehidupan sehari-hari.

Secara geografis, Ponorogo dikelilingi oleh pegunungan dan perbukitan, yang membuat wilayah ini memiliki udara yang sejuk dan pemandangan alam yang indah. Selain Reog, Ponorogo juga terkenal dengan berbagai acara budaya, pasar tradisional, dan kuliner khas seperti Sate Ponorogo dan Mie Lethak. Masyarakatnya dikenal ramah dan menjunjung tinggi gotong royong, sehingga budaya sosial di kabupaten ini masih terasa kuat.

3. Code Explanation

Github repos: https://github.com/mamahda/WebProg_Quiz_1

- a. "quiz1/index.html"
 - Main structure of the website.
 - Uses Montserrat font from Google Fonts.
 - Links CSS files for each page and navbar.
 - Navbar with links to Home, Profile, Hometown, Local Food, and Tourist Place.
 - Page content is loaded into `<div id="app"></div>` using main.js.
- b. "quiz1/main.js"
 - Imports: Load page modules and initTourist.
 - Routes: Map URL paths to each page.
 - `navigateTo()`: Change URL with `pushState` and call `router()`.
 - `router()`: Load page content into `<div id="app">`, add transition, reset scroll, and run `initTourist` if needed.
 - Events: Handle link clicks, back/forward navigation, and first load.

c. “quiz1/styles/animation.css”

- This is where all the animation is stored.
- `slideDown` : moves content from top to bottom with fade-in effect.
- `slideDown-noOpacity` : same as `slideDown` but without fade-in (only sliding).
- `zoomIn` : makes elements grow bigger while fading in.
- `window` : expands width from 0 to 50rem while becoming visible.
- `window2` : expands width from 0 to 70rem smoothly.
- `fadeIn` : slowly makes the element visible.
- `bounce` : makes elements move up and down like bouncing.
- `slideOut` : moves content down until it disappears.
- `slide-cards` : moves cards to the left for continuous scrolling effect.
- `gradientMove` : animates background gradient colors from left to right and back.
- `slideAnimation` : moves slides horizontally for slideshow effect.

d. “quiz1/styles/root-styles.css”

- Defines color and gradient variables for the theme.
- Sets body with no margin and no horizontal scroll.
- `.page-out` class for page out transition animation.
- Hides scrollbar for a clean look.

e. “quiz1/styles/navbar-styles.css”

- `.navbar`: Fixed at the top center of the page with high z-index.
- `.navbar-container`: Styles the main navbar box.
- `.navbar-nav` and `ul`: Arrange navigation items in a horizontal row with spacing.
- `li`: Removes default list style.
- `a`: White text, no underline, smooth hover effect. On hover, text changes to gradient color and scales up slightly.

f. “quiz1/pages/home.js” and “quiz1/styles/home-styles.css”

- The Home page shows the student’s name and ID number in the center.
- It uses flexbox to make the content centered both vertically and horizontally.
- The background is set to white with a clean and simple style.
- `h1` is big, bold, and uses a color gradient effect with animation.
- The title also has zoom-in animation when it appears.
- A small description box appears below the title with a border and rounded corners.
- The description box uses an animation that makes it expand like a window opening.

- The text inside the description fades in smoothly with animation.
 - The font used is Montserrat, giving a modern and clear look.
- g. “quiz1/pages/profile.js” and “quiz1/styles/profile-styles.css”
- The Profile page has two main parts:
 1. On the left side, there is a photo, personal information , and social media links.
 2. On the right side, there are two cards: one for About Me and one for Experience.
 - The layout uses a big box in the center with rounded corners and a soft shadow, so it looks like a profile card.
 - The photo and text appear with animations, making them slide and zoom when the page loads.
 - The social media links are shown in a column with icons and text. When the mouse hovers, the text changes color and shows underline.
 - The About Me card has a short introduction, written with clear and simple text.
 - The Experience card is like a timeline. It has a vertical line with small dots to show different activities or jobs. Each item has a title, date, and description in a small box with shadow and rounded corners.
 - The design uses blue and neutral colors from variables, animations for smooth effects, and shadows for a clean and modern look.
 - Overall, it looks like a professional portfolio page with a simple, structured, and easy-to-read style.
- h. “quiz1/pages/hometown.js” and “quiz1/styles/hometown-styles.css”
- The Hometown page shows information about Ponorogo.
 - At the top, there is a hero section with a background image of Reog Ponorogo and the title Kabupaten Ponorogo.
 - A scroll-down animation tells the user to move down.
 - The main content is inside cards, each with a title, description, and a link for more info.
 - The design uses a two-column grid for "History" and "Culture".
 - Styles include white background, dark blue accent colors, and box shadows for a clean look.
 - Animations like slide-down and bounce are used to make the page more dynamic.
 - Fonts use Montserrat for a modern and simple appearance.
- i. “quiz1/pages/food.js” and “quiz1/styles/food-styles.css”
- The Food page shows traditional foods from Ponorogo in a slider format.

- At the top, there is a header with a big title and subtitles that use animation when appearing.
 - The slider container holds food cards and moves automatically from side to side.
 - Each card shows an image of the food with a shadow and rounded corners.
 - When you hover a card, it shows more details about the food, the hidden content box inside the card rotates up to show the food name and description.
 - The design uses flexbox to align items and make the slider smooth.
 - The animation stops if the user hovers over the slider.
 - The style uses modern fonts, gradient colors, and soft shadows to make it look attractive.
- j. “quiz1/pages/tourist.js” and “quiz1/styles/tourist-styles.css”
- The Tourist page shows beautiful tourist spots in Ponorogo using a slideshow.
 - Each slide takes the full screen, showing a big background image of the place.
 - At the bottom of each slide, there is text content with the name and a short description.
 - The user can click on the slide to move to the next place.
 - If the text area is clicked, it stays on the current slide (the click does not change the slide).
 - The slides are placed inside a flex container that moves horizontally.
 - CSS styling makes the background images cover the screen, with white text and shadows for readability.
 - The design uses smooth layout, full-screen display, and centered content for a modern look.
 - The animation plays when the page opens, making the transition more attractive.

4. Analysis or Evaluation

My project is a multi page website with pages for Home, Profile, Hometown, Food, and Tourist. The routing is clear and makes it easy to move between pages, but the website is not responsive yet, so it does not look good on mobile. The design is creative with gradient text, hero images, sliding cards, and a slideshow. Each page has its own layout and content that shows culture, food, and tourist places. I used many CSS animations like slideDown, zoomIn, bounce, and fadeIn to make the site more lively. This makes the website attractive, but too many animations can also feel heavy. The code is clean and easy to read, but sometimes has repeated parts, and there are no

media queries for mobile support. The content is informative and unique, especially about Ponorogo culture and local food, but some descriptions are a bit long. Overall, the project is creative, clear, and full of information, but it needs improvements in responsiveness, shorter text, and more efficient code.

5. Conclusion

In conclusion, this project shows a creative and informative website with clear routing, unique content, and engaging animations. While it is well-structured and visually attractive, the next step should focus on making the website responsive and improving code efficiency for better performance.
